

*Increase Safety & Remote Management of Your Operation  
with Red Zone Detection Alerting & Remote Viewing*

The IWS Camera Module offers easy viewing of camera footage via local workstations and/or remote access via cloud. It supports fixed and PTZ (Pan Tilt Zoom) cameras for visual and thermal imaging. Users can connect and control cameras onsite or remotely using Video Management Software (VMS). The module is available in one or two sets of cameras based on customer needs (3 cameras per set).

Featuring red zone detection with programmable zones, the system allows users to create alerts. The primary module includes a Visual PTZ mounted on a 19ft telescoping mast, while Cameras 2 and 3 are on 12ft tripods within a 300ft range. Connectivity requires an iHUB (inVision® HUB) or Starlink module.

The modules come with a Network Video Recorder (NVR), storing up to 8TB of footage. Historical video playback spans 30 days or until storage capacity is reached. A single 4K, 30FPS channel consumes around 70-80GB/day.

The addition of camera modules to your operation increases remote viewing and management of your operations and increases safety by alerting when the red zone is entered.
