

## *Harness the Power of inVision Live™ on-the-go with inVision Mobile™*

Intelligent Wellhead Systems created inVision Mobile to allow real-time monitoring and visualization of operational data in the palm of your hand. Using a mobile device, users can now access their most important wellsite data anytime, anywhere – empowering them to make data-driven decisions remotely.

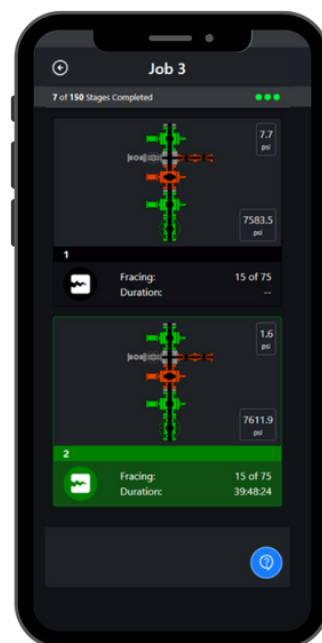

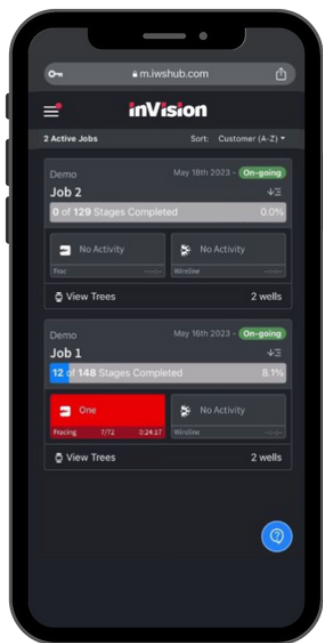

All wellsites equipped with IWS safety and efficiency controls now benefit from seamless access to inVision Mobile and remote monitoring. Existing users can conveniently monitor pad progress and real-time well activities by monitoring wells, frac trees, live valve positions, and the duration of ongoing operational activities.

When processing frac and wireline data through IWS, users gain the ability to visualize frac and wireline plots remotely. Explore a preset plot containing the most relevant data and effortlessly toggle additional channels on or off using the plot data configuration option.

Enabled with chat functionality, users can access immediate assistance by utilizing the direct chat window to connect with the 24-hour IWS Remote Operations Center (ROC). Simply 'click' the blue chat bubble located on the bottom right-hand side of the interface.

To access inVision Mobile, log in to <http://m.iwshub.com> using on your mobile device using your same credentials as used for inVision Live.

Start your mobile inVision experience today with remote monitoring and decision making that drive timely, data-based decisions and operational success.
