

Increase Efficiency & Safety with Insight into Your Operations

inVision Wellsite is a comprehensive solution designed to streamline the monitoring and management of onsite well operations. It is one of 3 applications in the inVision® platform, which also includes inVision Live™ and inVision Mobile™.

At its core, inVision Wellsite offers a digital twin of onsite operations providing a virtual representation that fosters transparency across the entire site. This feature enables stakeholders to gain a clear understanding of ongoing activities without the need for physical presence. An inVision HUB™ (iHUB) serves as the central unit for data collection from 3rd parties and visualization either through tables or HMI and includes sensor integration which utilizes a variety of sensors including pressure sensors, handle position sensors, and valve position sensors. These sensors enable real-time monitoring of critical parameters ensuring that any deviations or anomalies are promptly detected and addressed. It also encompasses a wireline detection spool.

Remote communication is another key feature which allows stakeholders to access and communicate with onsite operations remotely. This functionality is facilitated through tablets which provide a convenient interface for accessing operational information and foster efficient collaboration amongst team members – regardless of their physical location.

Furthermore, the system incorporates a Digital Handshake® process, which ensures secure and efficient communication among stakeholders. To bolster accountability and reporting, an activity log keeps track of onsite decisions providing a digital trail for increased transparency and oversight. Additionally, graphical data representation offers a visual depiction of captured data, enabling stakeholders to analyze both live and historical information for informed decision-making.

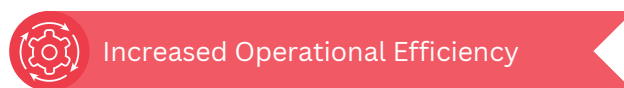

inVision Wellsite increases safety by providing real-time monitoring and alerts through its sensor integration capabilities. By leveraging various sensors, the system helps prevent potential hazards and creates a safer work environment. To enhance operational efficiency, the system offers iconic visualization of well activity, representing well activities through visual icons for easy comprehension. Well status updates keep stakeholders informed about the current status of wells facilitating proactive management and response to changes.

Overall, inVision Wellsite is a scalable solution designed to adapt to the evolving needs of onsite operations. Addressing challenges such as limited visibility, safety concerns, operational delays, inefficient communication, and unpredictable well conditions significantly improves the efficiency, safety, and transparency of onsite operations.
