

Enhanced Operations with Seamlessly Integrated AI-Enabled Surveillance & Communications

The SiteComms HUB A1.0 was designed to combine the features of both SiteVision™ and SiteComms Radio™ into a single box to further enhance connectivity and operational efficiency. It combines both visual surveillance through its integrated AI enabled cameras with the ability to communicate directly with those onsite through the inVision® dashboard and existing radio devices.

It offers an extended 4-hour UPS backup for easy field replacement and a redesigned Server Broker Unit for a robust network and improved intra-module communication. Enhanced protection and power distribution are provided along with an integrated Power Monitoring Box for redundant UPS alerts. The SiteComms HUB A1.0 features dual omni-directional antennas for simplified cellular network design and an advanced Wi-Fi AP that delivers faster, extended-range connections. A high-performance lay-flat Starlink dish ensures reliable internet service and improved speeds. Additionally, the SiteComms HUB A1.0 includes a built-in PTZ camera mounted on the mast and an SCU that allows SiteVision algorithms to run without a CAM unit.

As the core of the inVision® system, the SiteComms HUB A1.0 connects field operations to user desktops, housing essential components such as energy distribution, computing, and communication systems. It comprises two main systems: ACS for pneumatic energy supply and UPS for power backup. Passive systems like the VDB and SBU manage energy distribution and act as the main processing unit for inVision. With upgraded cellular and Wi-Fi connectivity, the SiteComms HUB A1.0 provides a comprehensive solution for onsite operations.

As with other hubs, the SiteComms HUB A1.0 offers seamless integration of operational data and onsite operations, eliminating the need for third-party integration. This allows wellsite managers to monitor onsite operations remotely and enables offsite stakeholders to oversee operations effectively. The SiteComms HUB A1.0's immediate access to onsite communications through both verbal communication and visual surveillance empowers the chain of command to stay informed whenever and wherever necessary, setting it apart from other products in the market.

Start your journey to operational efficiency with your operational communications and site surveillance integrated in a single system today!
